Product Code Demystified

- T: Thumb
- D: On-chip debug support
- M: Enhanced multiplier
- I: Embedded ICE hardware
- T2: Thumb-2
- S: Synthesizable code
- E: Enhanced DSP instruction set
- J: JAVA support, Jazelle
- Z: Should be TrustZone?
- F: Floating point unit
- H: Handshake, clockless design for synchronous or asynchronous design
ARM Processor Cores (1/4)

- ARM processor core + cache + MMU → ARM CPU cores
- ARM6 → ARM7
  - 3-stage pipeline
  - Keep its instructions and data in the same memory system
  - Thumb 16-bit compressed instruction set
  - On-chip Debug support, enabling the processor to halt in response to a debug request
  - Enhanced Multiplier, 64-bit result
  - Embedded ICE hardware, give on-chip breakpoint and watchpoint support
ARM Processor Cores (2/4)

- ARM8 → ARM9
  → ARM10

- ARM9
  - 5-stage pipeline (130 MHz or 200MHz)
  - Using separate instruction and data memory ports

  - High performance, 300 MHz
  - Multimedia digital consumer applications
  - Optional vector floating-point unit
ARM Processor Cores (3/4)

- **ARM11 (2002 Q4)**
  - 8-stage pipeline
  - Addresses a broad range of applications in the wireless, consumer, networking and automotive segments
  - Support media accelerating extension instructions
  - Can achieve 1GHz
  - Support AXI

- **SecurCore Family**
  - Smart card and secure IC development
Cortex Family

- Provides a large range of solutions optimized around specific market applications across the full performance spectrum
  - ARM Cortex-A Series, applications processors for complex OS and user applications.
    • Supports the ARM, Thumb and Thumb-2 instruction sets
  - ARM Cortex-R Series, embedded processors for real-time systems.
    • Supports the ARM, Thumb, and Thumb-2 instruction sets
  - ARM Cortex-M Series, deeply embedded processors optimized for cost sensitive applications.
    • Supports the Thumb-2 instruction set only
ARM Processor Core
ARM Architecture Version (1/6)

- **Version 1**
  - The first ARM processor, developed at Acorn Computers Limited 1983-1985
  - 26-bit address, no multiply or coprocessor support

- **Version 2**
  - Sold in volume in the Acorn Archimedes and A3000 products
  - 26-bit addressing, including 32-bit result multiply and coprocessor

- **Version 2a**
  - Coprocessor 15 as the system control coprocessor to manage cache
  - Add the atomic load store (SWP) instruction
ARM Architecture Version (2/6)

Version 3

- First ARM processor designed by ARM Limited (1990)
- ARM6 (macro cell)
  ARM60 (stand-alone processor)
  ARM600 (an integrated CPU with on-chip cache, MMU, write buffer)
  ARM610 (used in Apple Newton)
- 32-bit addressing, separate CPSR and SPSRs
- Add the undefined and abort modes to allow coprocessor emulation and virtual memory support in supervisor mode

Version 3M

- Introduce the signed and unsigned multiply and multiply-accumulate instructions that generate the full 64-bit result
ARM Architecture Version (3/6)

- **Version 4**
  - Add the signed, unsigned half-word and signed byte load and store instructions
  - Reserve some of SWI space for architecturally defined operation
  - System mode is introduced

- **Version 4T**
  - 16-bit Thumb compressed form of the instruction set is introduced

- **Version 5T**
  - Introduced recently, a superset of version 4T adding the BLX, CLZ and BRK instructions

- **Version 5TE**
  - Add the signal processing instruction set extension
Version 6

- Media processing extensions (SIMD)
  - 2x faster MPEG4 encode/decode
  - 2x faster audio DSP

- Improved cache architecture
  - Physically addressed caches
  - Reduction in cache flush/refill
  - Reduced overhead in context switches

- Improved exception and interrupt handling
  - Important for improving performance in real-time tasks

- Unaligned and mixed-endian data support
  - Simpler data sharing, application porting and saves memory
ARM Architecture Version (5/6)

3-Stage Pipeline ARM Organization

- **Register Bank**
  - 2 read ports, 1 write port, access any register
  - 1 additional read port, 1 additional write port for r15 (PC)

- **Barrel Shifter**
  - Shift or rotate the operand by any number of bits

- **ALU**

- **Address register and incrementer**

- **Data Registers**
  - Hold data passing to and from memory

- **Instruction Decoder and Control**
3-Stage Pipeline (1/2)

- **Fetch**
  - The instruction is fetched from memory and placed in the instruction pipeline

- **Decode**
  - The instruction is decoded and the datapath control signals prepared for the next cycle

- **Execute**
  - The register bank is read, an operand shifted, the ALU result generated and written back into destination register
3-Stage Pipeline (2/2)

- At any time slice, 3 different instructions may occupy each of these stages, so the hardware in each stage has to be capable of independent operations.

- When the processor is executing data processing instructions, the latency = 3 cycles and the throughput = 1 instruction/cycle.
Multi-Cycle Instruction

- Memory access (fetch, data transfer) in every cycle
- Datapath used in every cycle (execute, address calculation, data transfer)
- Decode logic generates the control signals for the data path use in next cycle (decode, address calculation)
Data Processing Instruction

- All operations take place in a single clock cycle
Computes a memory address similar to a data processing instruction.

Load instruction follows a similar pattern except that the data from memory only gets as far as the ‘data in’ register on the 2nd cycle and a 3rd cycle is needed to transfer the data from there to the destination register.
Branch Instructions

The third cycle, which is required to complete the pipeline refilling, is also used to mark the small correction to the value stored in the link register in order that it points directly at the instruction which follows the branch.
### Branch Pipeline Example

</tr>
</tbody>
</table>

- **Breaking the pipeline**
- **Note that the core is executing in the ARM state**
5-Stage Pipeline ARM Organization

- \[ T_{\text{prog}} = N_{\text{inst}} \times \text{CPI} / f_{\text{clk}} \]
  - \( T_{\text{prog}} \): the time that executes a given program
  - \( N_{\text{inst}} \): the number of ARM instructions executed in the program => compiler dependent
  - \( \text{CPI} \): average number of clock cycles per instructions => hazard causes pipeline stalls
  - \( f_{\text{clk}} \): frequency

- Separate instruction and data memories => 5 stage pipeline

- Used in ARM9TDMI
5-Stage Pipeline Organization (1/2)

- **Fetch**
  - The instruction is fetched from memory and placed in the instruction pipeline

- **Decode**
  - The instruction is decoded and register operands read from the register files. There are 3 operand read ports in the register file so most ARM instructions can source all their operands in one cycle

- **Execute**
  - An operand is shifted and the ALU result generated. If the instruction is a load or store, the memory address is computed in the ALU
5-Stage Pipeline Organization (2/2)

- Buffer/Data
  - Data memory is accessed if required. Otherwise the ALU result is simply buffered for one cycle.

- Write back
  - The result generated by the instruction are written back to the register file, including any data loaded from memory.
Pipeline Hazards

There are situations, called hazards, that prevent the next instruction in the instruction stream from being executing during its designated clock cycle. Hazards reduce the performance from the ideal speedup gained by pipelining.

There are three classes of hazards:

- **Structural Hazards**
  - They arise from resource conflicts when the hardware cannot support all possible combinations of instructions in simultaneous overlapped execution.

- **Data Hazards**
  - They arise when an instruction depends on the result of a previous instruction in a way that is exposed by the overlapping of instructions in the pipeline.

- **Control Hazards**
  - They arise from the pipelining of branches and other instructions that change the PC
Structural Hazards

- When a machine is pipelined, the overlapped execution of instructions requires pipelining of functional units and duplication of resources to allow all possible combinations of instructions in the pipeline.

- If some combination of instructions cannot be accommodated because of a resource conflict, the machine is said to have a structural hazard.
Example

A machine has shared a single-memory pipeline for data and instructions. As a result, when an instruction contains a data-memory reference (load), it will conflict with the instruction reference for a later instruction (instr 3):

<table>
<thead>
<tr>
<th>Clock cycle number</th>
</tr>
</thead>
<tbody>
<tr>
<td>instr 1</td>
</tr>
<tr>
<td>instr 2</td>
</tr>
<tr>
<td>instr 3</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>instr</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>load</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instr 1</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instr 2</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Instr 3</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To resolve this, we *stall* the pipeline for one clock cycle when a data-memory access occurs. The effect of the stall is actually to occupy the resources for that instruction slot. The following table shows how the stalls are actually implemented.

<table>
<thead>
<tr>
<th>Clock cycle number</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>instr</strong></td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>Instr 1</td>
</tr>
<tr>
<td>Instr 2</td>
</tr>
<tr>
<td>Instr 3</td>
</tr>
</tbody>
</table>
Solution (2/2)

- Another solution is to use separate instruction and data memories.
- ARM belongs to the Harvard architecture, so it does not suffer from this hazard
Data Hazards

Data hazards occur when the pipeline changes the order of read/write accesses to operands so that the order differs from the order seen by sequentially executing instructions on the unpipelined machine.

<table>
<thead>
<tr>
<th></th>
<th>Clock cycle number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>ADD</td>
<td>R1,R2,R3</td>
</tr>
<tr>
<td>SUB</td>
<td>R4,R5,R1</td>
</tr>
<tr>
<td>AND</td>
<td>R6,R1,R7</td>
</tr>
<tr>
<td>OR</td>
<td>R8,R1,R9</td>
</tr>
<tr>
<td>XOR</td>
<td>R10,R1,R11</td>
</tr>
</tbody>
</table>
The problem with data hazards, introduced by this sequence of instructions can be solved with a simple hardware technique called **forwarding**.
Forwarding architecture works as follows:

- The ALU result from the EX/MEM register is always fed back to the ALU input latches.
- If the forwarding hardware detects that the previous ALU operation has written the register corresponding to the source for the current ALU operation, control logic selects the forwarded result as the ALU input rather than the value read from the register file.

Forwarding paths
Forward Data

<table>
<thead>
<tr>
<th>Clock cycle number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>ADD</td>
</tr>
<tr>
<td>SUB</td>
</tr>
<tr>
<td>AND</td>
</tr>
</tbody>
</table>

- The first forwarding is for value of \textbf{R1} from EX\textsubscript{add} to EX\textsubscript{sub}.
- The second forwarding is also for value of \textbf{R1} from MEM\textsubscript{add} to EX\textsubscript{and}.
- This code now can be executed without stalls.

- Forwarding can be generalized to include passing the result directly to the functional unit that requires it: a result is forwarded from the output of one unit to the input of another, rather than just from the result of a unit to the input of the same unit.
### Without Forward

<table>
<thead>
<tr>
<th>Clock cycle number</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SUB</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>R4, R5, R1</td>
<td>IF</td>
<td></td>
<td>stall</td>
<td>stall</td>
<td>ID_{sub}</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
</tr>
<tr>
<td>AND</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>R6, R1, R7</td>
<td>stall</td>
<td>stall</td>
<td>IF</td>
<td>ID_{and}</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Data Forwarding

- Data dependency arises when an instruction needs to use the result of one of its predecessors before the result has returned to the register file => pipeline hazards
- Forwarding paths allow results to be passed between stages as soon as they are available
- 5-stage pipeline requires each of the three source operands to be forwarded from any of the intermediate result registers
- Still one load stall
  
  LDR rN, [...] 
  ADD r2,r1,rN  ;use rN immediately
  – One stall
  – Compiler rescheduling
### Stalls are Required

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDR</td>
<td>R1,@(R2)</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SUB</td>
<td>R4,R1,R5</td>
<td>IF</td>
<td>ID</td>
<td>EX&lt;sub&gt;sub&lt;/sub&gt;</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AND</td>
<td>R6,R1,R7</td>
<td>IF</td>
<td>ID</td>
<td>EX&lt;sub&gt;and&lt;/sub&gt;</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OR</td>
<td>R8,R1,R9</td>
<td>IF</td>
<td>ID</td>
<td>EXE</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- The load instruction has a delay or latency that cannot be eliminated by forwarding alone.
The Pipeline with one Stall

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>LDR</td>
<td>R1,@(R2)</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SUB</td>
<td>R4,R1,R5</td>
<td>IF</td>
<td>ID</td>
<td>stall</td>
<td>EX&lt;sub&gt;sub&lt;/sub&gt;</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
<tr>
<td>AND</td>
<td>R6,R1,R7</td>
<td>IF</td>
<td>stall</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OR</td>
<td>R8,R1,R9</td>
<td>stall</td>
<td>IF</td>
<td>ID</td>
<td>EX</td>
<td>MEM</td>
<td>WB</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- The only necessary forwarding is done for R1 from MEM to EX<sub>sub</sub>.
In this example, it takes 7 clock cycles to execute 6 instructions, CPI of 1.2

- The LDR instruction immediately followed by a data operation using the same register cause an interlock
## Optimal Pipelining

### Table

<table>
<thead>
<tr>
<th>Operation</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD R1, R1, R2</td>
<td>F</td>

<td>F</td>
<td>D</td>
<td>E</td>
<td>W</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>EOR R3, R1, R2</td>
<td>F</td>
<td>D</td>
<td>E</td>
<td>W</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*F - Fetch  D - Decode  E - Execute  I - Interlock  M - Memory  W - Writeback*

- In this example, it takes 6 clock cycles to execute 6 instructions, CPI of 1
- The LDR instruction does not cause the pipeline to interlock
LDM Interlock (1/2)

In this example, it takes 8 clock cycles to execute 5 instructions, CPI of 1.6

During the LDM there are parallel memory and writeback cycles
In this example, it takes 9 clock cycles to execute 5 instructions, CPI of 1.8

The SUB incurs a further cycle of interlock due to it using the highest specified register in the LDM instruction
8-Stage Pipeline (v6 Architecture)

- 8-stage pipeline
- Data forwarding and branch prediction
  - Dynamic/static branch prediction
- Improved memory access
  - Non-blocking
  - Hit-under-miss
- Pipeline parallelism
  - ALU/MAC, LSU
  - LS instruction won’t stall the pipeline
  - Out-of-order completion

Introduction to Several ARM processors
ARM7TDMI Processor Core

- Current low-end ARM core for applications like digital mobile phones
- TDMI
  - T: Thumb, 16-bit compressed instruction set
  - D: on-chip Debug support, enabling the processor to halt in response to a debug request
  - M: enhanced Multiplier, yield a full 64-bit result, high performance
  - I: Embedded ICE hardware
- Von Neumann architecture
- 3-stage pipeline, CPI ~ 1.9

</tbody>
</table>
ARM7TDMI Interface Signals (3/4)

- Lock indicates that the processor should keep the bus to ensure the atomicity of the read and write phase of a SWAP instruction
  - \(r/w\), read or write
  - \(mas[1:0]\), encode memory access size – byte, half-word or word
  - \(bl[3:0]\), externally controlled enables on latches on each of the 4 bytes on the data input bus

- **MMU interface**
  - \(trans\) (translation control), 0: user mode, 1: privileged mode
  - \(mode[4:0]\), bottom 5 bits of the CPSR (inverted)
  - Abort, disallow access

- **State**
  - \(T\) bit, whether the processor is currently executing ARM or Thumb instructions

- **Configuration**
  - Bigend, big-endian or little-endian
ARM7TDMI Interface Signals (4/4)

- **Interrupt**
  - \( \text{fiq} \), fast interrupt request, higher priority
  - \( \text{irq} \), normal interrupt request
  - isync, allow the interrupt synchronizer to be passed

- **Initialization**
  - \( \text{reset} \), starts the processor from a known state, executing from address 00000000_{16}

- **ARM7TDMI characteristics**

Memory Access

- The ARM7 is a Von Neumann, load/store architecture, i.e.,
  - Only 32 bit data bus for both instr. and data.
  - Only the load/store instr. (and SWP) access memory.
- Memory is addressed as a 32 bit address space
- Data type can be 8 bit bytes, 16 bit half-words or 32 bit words, and may be seen as a byte line folded into 4-byte words
- Words must be aligned to 4 byte boundaries, and half-words to 2 byte boundaries.
- Always ensure that memory controller supports all three access sizes
ARM Memory Interface

- **Sequential (S cycle)**
  - \((nMREQ, SEQ) = (0, 1)\)
  - The ARM core requests a transfer to or from an address which is either the same, or one word or one-half-word greater than the preceding address.

- **Non-sequential (N cycle)**
  - \((nMREQ, SEQ) = (0, 0)\)
  - The ARM core requests a transfer to or from an address which is unrelated to the address used in the preceding address.

- **Internal (I cycle)**
  - \((nMREQ, SEQ) = (1, 0)\)
  - The ARM core does not require a transfer, as it performing an internal function, and no useful prefetching can be performed at the same time.

- **Coprocessor register transfer (C cycle)**
  - \((nMREQ, SEQ) = (1, 1)\)
  - The ARM core wished to use the data bus to communicate with a coprocessor, but does no require any action by the memory system.
Cached ARM7TDMI Macrocells

- **ARM710T**
  - 8K unified write through cache
  - Full memory management unit supporting virtual memory
  - Write buffer

- **ARM720T**
  - As ARM 710T but with WinCE support

- **ARM 740T**
  - 8K unified write through cache
  - Memory protection unit
  - Write buffer
ARM8

- Higher performance than ARM7
  - By increasing the clock rate
  - By reducing the CPI
    - Higher memory bandwidth, 64-bit wide memory
    - Separate memories for instruction and data accesses

- Core Organization
  - The prefetch unit is responsible for fetching instructions from memory and buffering them (exploiting the double bandwidth memory)
  - It is also responsible for branch prediction and use static prediction based on the branch prediction (backward: predicted ‘taken’; forward: predicted ‘not taken’)
Pipeline Organization

- 5-stage, prefetch unit occupies the 1st stage, integer unit occupies the remainder

1. Instruction prefetch
2. Instruction decode and register read
3. Execute (shift and ALU)
4. Data memory access
5. Write back results
ARM8 Macrocell

- ARM810
  - 8Kbyte unified instruction and data cache
  - Copy-back
  - Double-bandwidth
  - MMU
  - Coprocessor
  - Write buffer
ARM9TDMI

- Harvard architecture
  - Increases available memory bandwidth
    - Instruction memory interface
    - Data memory interface
  - Simultaneous accesses to instruction and data memory can be achieved

- 5-stage pipeline

- Changes implemented to
  - Improve CPI to ~1.5
  - Improve maximum clock frequency

SOC Consortium Course Material
ARM9TDMI Pipeline Operations (1/2)

ARM7TDMI:

- Fetch
  - instruction fetch
- Decode
  - Thumb decompress
  - ARM decode
- Execute
  - reg read
  - shift/ALU
  - reg write

ARM9TDMI:

- Fetch
- Decode
  - r. read
  - decode
- Execute
  - shift/ALU
- Memory
  - data memory access
- Write
  - reg write

Not sufficient slack time to translate Thumb instructions into ARM instructions and then decode, instead the hardware decode both ARM and Thumb instructions directly.
ARM9TDMI Pipeline Operations (2/2)

- Coprocessor support
  - Coprocessors: floating-point, digital signal processing, special-purpose hardware accelerator

- On-chip debugger
  - Additional features compared to ARM7TDMI
    - Hardware single stepping
    - Breakpoint can be set on exceptions

- ARM9TDMI characteristics

ARM9TDMI Macrocells (1/2)

- **ARM920T**
  - 2 × 16K caches
  - Full memory management unit supporting virtual addressing and memory protection
  - Write buffer
ARM9TDMI Macrocells (2/2)

- **ARM 940T**
  - 2 x 4K caches
  - Memory protection Unit
  - Write buffer
ARM9E-S Family Overview

- ARM9E-S is based on an ARM9TDMI with the following extensions:
  - Single cycle 32*6 multiplier implementation
  - EmbeddedICE logic RT
  - Improved ARM/Thumb interworking
  - New 32*16 and 16*16 multiply instructions
  - New count leading zero instruction
  - New saturated math instructions

- ARM946E-S
  - ARM9E-S core
  - Instruction and data caches, selectable sizes
  - Instruction and data RAMs, selectable sizes
  - Protection unit
  - AHB bus interface
ARM926EJ-S

- ARMv5TEJ architecture (ARMv5TEJ)
- 32-bit ARM instruction and 16-bit Thumb instruction set
- DSP instruction extensions and single cycle MAC
- ARM Jazelle technology
- MMU which supports operating systems including Symbian OS, Windows CE, Linux
- Flexible instruction and data cache sizes
- Instruction and data TCM interfaces with wait state support
- EmbeddedICE-RT logic for real-time debug
- Industry standard AMBA bus AHB interfaces
- ETM interface for Real-time trace capability with ETM9
- Optional MOVE Coprocessor delivers video encoding performance

ARM10TDMI (1/2)

- Current high-end ARM processor core
- Performance on the same IC process

ARM10TDMI $\times 2$ ARM9TDMI $\times 2$ ARM7TDMI

- 300MHz, 0.25µm CMOS
- Increase clock rate

![ARM10TDMI Diagram]
ARM10TDMI (2/2)

- Reduce CPI
  - Branch prediction
  - Non-blocking load and store execution
  - 64-bit data memory → transfer 2 registers in each cycle
ARM1020T Overview

- Architecture v5T
  - ARM1020E will be v5TE
- CPI ~ 1.3
- 6-stage pipeline
- Static branch prediction
- 32KB instruction and 32KB data caches
  - ‘hit under miss’ support
- 64 bits per cycle LDM/STM operations
- Embedded ICE Logic RT-II
- Support for new VFPv1 architecture
- ARM10200 test chip
  - ARM1020T
  - VFP10
  - SDRAM memory interface
  - PLL
ARM1176JZ(F)-S

- Powerful ARMv6 instruction set architecture
  - Thumb, Jazelle, DSP extensions
  - SIMD (Single Instruction Multiple Data) media processing extensions deliver up to 2x performance for video processing

- Energy-saving power-down modes
  - Reduce static leakage currents when processor is not in use

- High performance integer processor
  - 8-stage integer pipeline delivers high clock frequency
  - Separate load-store and arithmetic pipelines
  - Branch Prediction and Return Stack
  - Up to 660 Dhrystone 2.1 MIPS in 0.13µ process

- High performance memory system
  - Supports 4-64k cache sizes
  - Optional tightly coupled memories with DMA for multi-media applications
  - Multi-ported AMBA 2.0 AHB bus interface speeds instruction and data access
  - ARMv6 memory system architecture accelerates OS context-switch
ARM1176JZ(F)-S

- Vectored interrupt interface and low-interrupt-latency mode speeds interrupt response and real-time performance
- Optional Vector Floating Point coprocessor (ARM1136JF-S)
  - Powerful acceleration for embedded 3D-graphics

**0.13μm**
ARM11 MPCore

- Highly configurable
  - Flexibility of total available performance from implementations using between 1 and 4 processors.
  - Sizing of both data and instruction cache between 16K and 64K bytes across each processor.
  - Either dual or single 64-bit AMBA 3 AXI system bus connection allowing rapid and flexibility during SoC design
  - Optional integrated vector floating point (VFP) unit
  - Sizing on the number of hardware interrupts up to a total of 255 independent sources
ARM Cortex-A8

- Used for applications including mobile phones, set-up boxes, gaming consoles, and automotive navigation/entertainment systems
- High performance with low power consumption
ARM Cortex-A8

- **Architecture features**
  - Thumb-2 instruction
    - Add 130 additional instructions to Thumb
    - High density, high performance
  - NEON media and signal processing technology
    - For audio, video, and 3D graphics
    - Decode MPEG-4 VGA 30fps @ 275MHz and H.264 video @ 350MHz
  - TrustZone technology
  - VFPv3
ARM Cortex-A8

- **Superscalar pipeline**
  - Dual issue, in-order, statically scheduled ARM integer pipeline

Memory Hierarchy
Memory Size and Speed

- **On-chip cache memory**
  - Small
  - Fast
  - registers
  - Large capacity
  - Slow access time

- **2nd-level off chip cache**

- **Main memory**

- **Hard disk**
  - Expensive
  - Cheap

- **Cost**
Caches (1/2)

- A cache memory is a small, very fast memory that retains copies of recently used memory values.
- It usually implemented on the same chip as the processor.
- Caches work because programs normally display the property of **locality**, which means that at any particular time they tend to execute the same instruction many times on the same areas of data.
- An access to an item which is in the cache is called a **hit**, and an access to an item which is not in the cache is a **miss**.
A processor can have one of the following two organizations:

- A unified cache
  - This is a single cache for both instructions and data
- Separate instruction and data caches
  - This organization is sometimes called a modified Harvard architectures
Unified Instruction and Data Cache

- Processor
  - Registers
  - Cache
    - Copies of instructions
    - Copies of data
  - Address
  - Instructions and data

- Memory
  - Instructions
  - Data
  - Address
  - Instructions and data

FF..FF₁₆
00..00₁₆
Separate Data and Instruction Caches

![Diagram of separate data and instruction caches]

- **copies of instructions**
- **address**
- **instructions**
- **registers**
- **processor**
- **data**
- **address**
- **copies of data**
- **cache**
- **memory**
- FF..FF\(_{16}\)
- 00..00\(_{16}\)
The Direct-Mapped Cache

- The index address bits are used to access the cache entry.
- The top address bit are then compared with the stored tag.
- If they are equal, the item is in the cache.
- The lowest address bit can be used to access the desired item within the line.
The 8Kbytes of data in 16-byte lines. There would therefore be 512 lines.

A 32-bit address:
- 4 bits to address bytes within the line
- 9 bits to select the line
- 19-bit tag
A 2-way set-associative cache

This form of cache is effectively two direct-mapped caches operating in parallel.
The 8Kbytes of data in 16-byte lines. There would therefore be 256 lines in each half of the cache.

A 32-bit address:
- 4 bits to address bytes within the line
- 8 bits to select the line
- 20-bit tag
A **CAM** (Content Addressed Memory) cell is a RAM cell with an inbuilt comparator, so a CAM based tag store can perform a parallel search to locate an address in any location.

- The address bit are compared with the stored tag.
- If they are equal, the item is in the cache.
- The lowest address bit can be used to access the desired item with in the line.
The 8Kbytes of data in 16-byte lines. There would therefore be 512 lines.

A 32-bit address:
- 4 bits to address bytes within the line
- 28-bit tag
Write Strategies

- **Write-through**
  - All write operations are passed to main memory

- **Write-through with buffered write**
  - All write operations are still passed to main memory and the cache updated as appropriate, but instead of slowing the processor down to main memory speed the write address and data are stored in a *write buffer* which can accept the write information at high speed.

- **Copy-back (write-back)**
  - No kept coherent with main memory
Software Development
ARM Tools

- C source
- C libraries
- asm source

- C compiler
- assembler

- linker
- object libraries

- .aof
- debug
- .aif

- system model
- ARMsd
- ARMulator
- development board

- ARM software development – ADS
- ARM system development – ICE and trace
- ARM-based SoC development – modeling, tools, design flow

aof: ARM object format
aif: ARM image format
Develop and debug C/C++ or assembly language program

- `armcc` ARM C compiler
- `armcpp` ARM C++ compiler
- `tcc` Thumb C compiler
- `tcpp` Thumb C++ compiler
- `armasm` ARM and Thumb assembler
- `armlink` ARM linker
- `armsd` ARM and Thumb symbolic debugger
ARM Development Suite (ADS), ARM Software Development Toolkit (SDT) (2/3)

- `.aof` ARM object format file
- `.aif` ARM image format file

The `.aif` file can be built to include the debug tables
  - ARM symbolic debugger, ARMsd

ARMsd can load, run and debug programs either on hardware such as the ARM development board or using the software emulation of the ARM

AXD (ARM eXtended Debugger)
  - ARM debugger for Windows and Unix with graphics user interface
  - Debug C, C++, and assembly language source

CodeWarrior IDE
  - Project management tool for windows
Utilities

`armprof` ARM profiler

*Flash downloader* download binary images to Flash memory on a development board

Supporting software

- *ARMulator* ARM core simulator
  - Provide instruction accurate simulation of ARM processors and enable ARM and Thumb executable programs to be run on non-native hardware
  - Integrated with the ARM debugger

- *Angle* ARM debug monitor
  - Run on target development hardware and enable you to develop and debug applications on ARM-based hardware
ARM C Compiler

- Compiler is compliant with the ANSI standard for C
- Supported by the appropriate library of functions
- Use ARM Procedure Call Standard, APCS for all external functions
  - For procedure entry and exit
- May produce assembly source output
  - Can be inspected, hand optimized and then assembled sequentially
- Can also produce Thumb codes
**Linker**

- Take one or more object files and combine them
- Resolve symbolic references between the object files and extract the object modules from libraries
- Normally the linker includes debug tables in the output file
ARM Symbolic Debugger

- A front-end interface to debug program running either under emulator (on the ARMulator) or remotely on a ARM development board (via a serial line or through JTAG test interface).

- ARMsd allows an executable program to be loaded into the ARMulator or a development board and run. It allows the setting of:
  - Breakpoints, addresses in the code
  - Watchpoints, memory address if accessed as data address
    - Cause exception to halt so that the processor state can be examined
ARM Emulator (1/2)

- ARMulator is a suite of programs that models the behavior of various ARM processor cores in software on a host system
- It operates at various levels of accuracy
  - Instruction accuracy
  - Cycle accuracy
  - Timing accuracy
    - Instruction count or number of cycles can be measured for a program
    - Performance analysis
- Timing accuracy model is used for cache, memory management unit analysis, and so on
ARM Emulator (2/2)

- ARMulator supports a C library to allow complete C programs to run on the simulated system.
- To run software on ARMulator, through ARM symbolic debugger or ARM GUI debuggers, AXD.
- It includes:
  - Processor core models which can emulate any ARM core.
  - A memory interface which allows the characteristics of the target memory system to be modeled.
  - A coprocessor interface that supports custom coprocessor models.
  - An OS interface that allows individual system calls to be handled.
ARM Development Board

- A circuit board including an ARM core (e.g. ARM7TDMI), memory component, I/O and electrically programmable devices
- It can support both hardware and software development before the final application-specific hardware is available
ARM7TDMI
- Von Neumann architecture
- 3-stage pipeline
- CPI ~ 1.9

ARM9TDMI, ARM9E-S
- Harvard architecture
- 5-stage pipeline
- CPI ~ 1.5

ARM10TDMI
- Harvard architecture
- 6-stage pipeline
- CPI ~ 1.3
Summary (2/2)

- Cache
  - Direct-mapped cache
  - Set-associative cache
  - Fully associative cache

- Software Development
  - CodeWarrior
  - AXD
